## **RE: Latitude Business Park Development Project Greenhouse Gas (GHG) Update**

The purpose of this Greenhouse Gas (GHG) letter is to identify any significant impacts, if any, which may be created from the construction and operation of the proposed Latitude Business Park industrial/warehousing development. The proposed Project consists of developing multiple industrial/manufacturing/warehousing buildings up to 379,882 Square Feet (SF) of industrial usage and up to 159,744 SF of manufacturing usage and up to 535,205 SF warehouse space. The GHG analysis was updated due to the fact that up to 175,000 SF of that warehouse space could contain cold storage. Additionally, the project would install 82 Electric Vehicle (EV) Charging stations spread out over the project site and will only install High Efficiency LED lighting in all the facilities and will implement solid waste recycling program where at least 75% of the waste is diverted from landfills and recycled.

The Project is located on roughly a 75 gross acre site located on the west side of Temescal Canyon Road, between La Gloria Street Road and Tom Barnes Street, in the City of Corona, California. Project access will be provided via multiple points along Tom Barnes Street.

The project would start construction in 2020 and would be completed roughly 18 months after permits are issued and would be fully occupied in 2022.

GHG emissions from daily operations which would include sources such as Area, Energy, Mobile, Waste and Water uses. Area Sources include usage of consumer products, landscaping and architectural coatings as part of regular maintenance. Energy sources would be from uses such as electricity and natural gas. Solid waste generated in the form of trash is also considered as decomposition of organic material breaks down to form GHGs. GHGs from water are also indirectly generated through the conveyance of the resource via pumping throughout the state and as necessary for wastewater treatment. Finally, the project would also generate GHG emissions through the use of carbon fuel burning vehicles for transportation.

GHG impacts related to construction and daily operations were calculated using the latest CalEEMod 2016.3.2 air quality and GHG model, which was developed by Breeze Software for

South Coast Air Quality Management District (SCAQMD) in 2017. The City of Corona recognizes the CalEEMod Version 2016.3.2 as an acceptable model for projects of this nature.

The City of Corona guidelines for determining significance for GHGs under CEQA are identified in the CEQA Thresholds and Screening Tables prepared for the City of Corona by LSA in 2019. Under this methodology, projects could demonstrate compliance with the City's Climate Action Plan (CAP) by indicating how the project would achieve 100 points based on the City's screening checklist guidance. Upon achieving 100 points, the project would equally be screened out with respect to GHG and have a less than significant impact under CEQA. The City's screening tables give initial guidance for mitigating significance though does not specifically include a screening threshold. Also, the City's screening tables are geared more towards residential or commercial uses and provide little support for industrial uses with point schemes left mostly to be determined (TBD) (City of Corona, 2019).

The development of the point system is based on the City's planning that a total of 3,026 new residential units will be needed by 2030 and a total of approximately 4,970,550 square feet of new commercial and industrial buildings will be needed to accommodate anticipated job growth within the City. The CAP estimated that the growth would be 38 percent from the residential sector and 62 percent from commercial/industrial land uses. Using those ratios, the Screening Tables would need to reduce 6,147 MT CO<sub>2</sub>e from residential development and 9,943 MT CO<sub>2</sub>e from commercial/industrial development by 2030.

The City's CAP indicated that the Screening Tables for new commercial/industrial development would need to reduce 2.00 MT CO<sub>2</sub>e per 1,000 gross square feet of commercial/industrial building area. Given this, the project based on its size alone would be required to show a reduction in emission of 2,149.4 MT CO<sub>2</sub>e from the 2017 emissions scenario.

The City has also in the past indicated that small projects could alternatively demonstrate that the emissions for the development would not exceed a 3,000 MT for residential and mixed use projects and up to 10,000 MT for industrial projects per draft SCAQMD GHG screening thresholds (SCAQMD, 2008). These thresholds were developed for to identify projects which would have a less than significant GHG impact within the jurisdiction of SCAQMD.

### **Project Related Construction Emissions**

The proposed construction schedule and construction equipment list is identified in Table 1 and is consistent with the original GHG analysis prepared in June 2019. Additionally, if the Project's construction activities are to occur at a later date than analyzed in this report, construction equipment emissions are conservative due to the increase efficiency of construction equipment over time.

Air Compressors			1
This equipment list is based upon equipment inventory and estimates within CalEEMod 2016.3.2.			

The CalEEMod 2016.3.2 model was utilized to determine annual CO<sub>2</sub> emissions for the proposed construction years. The construction emissions as calculated in CalEEMod are reported in Metric Tons and are shown in Table 2. It should be noted that GHGs are analyzed on a Metric Ton per year (MT/year) which is why Annual emissions are estimated.

**Table 2: Expected Annual Construction CO<sub>2</sub> Emissions Summary - MT/Year**

Year	Bio-CO <sub>2</sub>	NBio-CO <sub>2</sub>	Total CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	CO <sub>2</sub> e
2020	0.00	2,080.34	2,080.34	0.18	0.00	2,084.74
2021	0.00	1,973.37	1,973.37	0.13	0.00	1,976.68
Expected Construction emissions are based upon CalEEMod modeling assumptions for equipment and durations listed in Table 1 above.						
CalEEMod annual output is attached to this letter.						

The City's CAP is based on Screening Tables mostly for operational emissions. This project is an industrial project and this analysis relies on a comparative analysis. The CAP indicates that the comparative analysis should be between the 2017 emissions scenario which is how the Screening Thresholds are derived. The project is required to show a reduction of 2,149.4 MT CO<sub>2</sub>e based on the size of this project and the requirement to reduce emissions by 2 MT CO<sub>2</sub>e per 1,000 SF of facility size. Since construction emissions are the same between each model the difference in emissions would be zero MT CO<sub>2</sub>e and GHG significance would be based on operations alone.

Alternatively, Using SCAQMDs screening threshold for industrial projects, if the project produces fewer than 10,000 MT CO<sub>2</sub>e per year during construction, a less than significant GHG impact would be expected from Construction. Since the highest emissions would be expected to be 2,084.74 MT per year, a less than significant GHG impact would be expected from construction.

### **Project Related Operational Emissions**

As previously discussed, emissions generated from Area, Energy, Mobile, Solid Waste and Water uses is also calculated within CalEEMod. The program is largely based on default settings which are automatically populated throughout the model based on the imputed land use. Statewide averages for utility emissions were utilized for the calculations throughout the model. The City of Corona recognizes CalEEMod as the preferred model for GHG emission calculations. The City's CAP requires that the Project would have less than significant GHG impacts if an industrial project either shows a reduction of 100 Point using the City's Screening Tables within the CAP or shows a reduction of 2.00 MT CO<sub>2</sub>e per 1,000 SF of commercial/industrial building area from the 2017 emissions scenario in 2030.

Industrial screening methodologies are limited within the City's Screening Tables with many of the suggested mitigation methodologies left as TBD. Based on this, the proposed Project will utilize the later methodology where the Project would be required to show a reduction of 2.00 MT CO<sub>2</sub>e per 1,000 SF. Since the modeling for the 2022 scenario was previously prepared and utilized within the Air Quality Study for the Project, the 2022 scenario was utilized. This comparison would be conservative since emissions within CalEEMod for 2017 would be higher.

As noted in the traffic analysis (See Table A of the traffic study), the traffic modeling assumed a higher trip count by modifying actual truck trips to passenger car equivalents (PCE) (LL&G, November 2019). Table A breaks down the actual trips based on the number axels each truck would have. Since GHG impacts are based on truck size (number of axels), this analysis uses actual truck trips based on axels as reported in the project traffic study (See Table A). Additionally, the model was updated to reflect the estimated weekday Vehicle Miles Traveled (VMT) expected by the project (Fehr & Peers, 2019) with a yearly estimate of 10,802,025 VMT.

## **Project Design Features (PDF)**

The Project will provide 82 Level II Electric Vehicle (EV) chargers which will allow for onsite charging of EV which is an incentive to workers onsite to purchase EV.

As background to EVs, a standard petroleum-based car is rated in miles per gallon (MPG), Zero Emission Vehicles (ZEVs) such as EV are typically rated in kilowatt hours per 100 miles traveled. The U.S. Department of Energy has developed a mile per gallon gasoline equivalent unit (MPGe) of 0.337 kWh/100 miles traveled (Department of Energy, 2000). The U.S. Department of Energy estimates that the average fuel economy for ZEVs in 2017 is as high as 136 MPGe for the midsize Hyundai Ioniq, having a range of 124 miles. The higher range Tesla Model S can achieve a range of 335 miles with a fuel efficiency of 102 MPGe. For purposes of analysis within this report, an average fuel efficiency of 100 MPGe is used. Also, EV miles are assumed to offset GHGs from light duty cars.

EV Chargers onsite are expected to be utilized on average over the network of chargers between 2 and 3 hours per day for at least 260 days per work year. Each Level 2 charging Location runs on a 220-volt system and is capable of providing between 6.6 and 19.2 kW of power. Based on this, for a 100 MPGe vehicle, each hour of charging will provide a range of 56.97 miles or 113.94 miles on a 2 hour charge per vehicle. The EV Charges may be utilized more than 2 hours a day and this would be conservative.

Given this design feature to install 82 level II EV charging locations, the chargers would provide enough charge for 9,343.08 zero emission-driven miles per day or 2,429,200.8 miles per a 260 day work year. Based on a review of annual outputs from CalEEMod, for Light Duty cars only reduce emissions by 0.00027 MT CO<sub>2</sub>e per mile traveled. Based on this, the installation of 82 Level II charging stations would reduce CO<sub>2</sub>e emissions by 0.00027 MT per mile traveled times 2,429,200.8 annual miles or 655.88 MT CO<sub>2</sub>e per year.

Also, as a design feature, the project will exclusively utilize high-efficiency indoor and outdoor lighting in all buildings. One example of high-efficiency lighting is light-emitting diode (LED) lighting. LED indoor lighting is 75-90% more efficient than standard lighting. For example: a 10 watt LED bulb replaces a 60 watt standard bulb, which would be 83% more efficient. A typical 15 watt LED bulb has an equivalent rating of a 100 watt standard bulb.

High-efficiency lighting is addressed by both the 2013 Title 24 standards (CEC, 2012) and the 2016 Title 24 standards (CEC, 2015); these standards specifically call out lighting power density requirements for non-residential land uses. However, the lighting power density requirements do not change across the two sets of Title 24 standards. Rather, as illustrated by Table 140.6-B within the 2013 and 2016 Title 24 standards, the applicable requirement is 0.60 watts per

SF. Of note, the default parameters of the version of CalEEMod used in this analysis (along with its predecessor versions) do not account for high-efficiency lighting technologies or the 2016 Title 24. For purposes of this analysis, the design feature to utilize 100% high-efficiency lighting would reduce energy usage from combined indoor and outdoor lighting by at least 75% which modified the intensity within CalEEMod directly.

As a design feature, the project would recycle and divert up at least 75% of solid waste. This requirement would be consistent with California's Assembly Bill 341 (AB-341) (State of California, 2011). As a design feature, the project would install low flow water fixtures within all restrooms and common areas. Also, the project would reduce outdoor water requirements by utilizing a native plant based landscaping scheme.

The 2022 emissions estimated within design features is shown in Table 3 below. Based on these findings, the Project would generate 9,650.61 MT CO<sub>2</sub>e. The CalEEMod output for this scenario is shown in **Attachment A** to this report. Using the City's CAP, the project would be required to reduce GHG emissions by 2.00 MT CO<sub>2</sub>e per 1,000 gross square feet of commercial/industrial building area or 2,149.4 MT CO<sub>2</sub>e.

**Table 3: Expected Operational Emissions Summary - MT/Year**

Year	Bio-CO <sub>2</sub>	NBio-CO <sub>2</sub>	Total CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	CO <sub>2</sub> e
Area	0.00	0.08	0.08	0.00	0.00	0.09
Energy	0.00	4,478.06	4,478.06	0.16	0.05	4,497.64
Mobile	0.00	4,755.94	4,755.94	0.23	0.00	4,761.64
Waste	237.94	0.00	237.94	14.06	0.00	589.48
Water	78.85	787.29	866.14	8.13	0.20	1,128.59
<b>Total</b>	<b>316.79</b>	<b>10,021.37</b>	<b>10,338.16</b>	<b>22.58</b>	<b>0.25</b>	<b>10,977.44</b>
82 EV Chargers						-655.88
LED Lighting						-523.58
Recycling Program						-147.37
<b>Total Operations with PDFs</b>	<b>316.79</b>	<b>10,021.37</b>	<b>10,338.16</b>	<b>22.58</b>	<b>0.25</b>	<b>9,650.61</b>
Modeling is based on the project design features to include High Efficiency LED lighting and Recycling Diversion onsite of at least 75%. Reductions from PDFs are shown separately.						

GHG emission from 2030 including reduction from design features identified above from the Project would be 7,495.78 MT CO<sub>2</sub>e and are shown in Table 4. The CalEEMod output for this scenario is shown in **Attachment B** to this report. Therefore, the reduction would be 3,481.66

Patrick Tritz

MT CO<sub>2</sub>e which exceeds the requirement to alternatively reach 100 points identified within the CAP. Based on this, the project would have a less than significant GHG impact and would therefore comply with the City's GHG policies under the CAP without mitigation. Based on this, the project would not be required to implement GHG design features beyond those required by local state and City regulations.

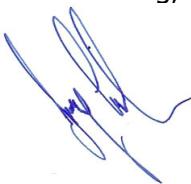

**Table 4: Expected Operational Emissions Summary 2030 - MT/Year**

Year	Bio-CO <sub>2</sub>	NBio-CO <sub>2</sub>	Total CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	CO <sub>2</sub> e

Modeling results shown for 2030 included PDFs. PDFs include 100% High Efficiency LED lighting, Low Flow water Fixtures and Recycling Diversion onsite of at least 75%						

Alternatively, using SCAQMDs screening threshold for industrial projects, since the project produces fewer than 10,000 MT CO<sub>2</sub>e screening threshold for industrial projects per year during operations in 2022, a less than significant GHG impact would be expected from the operations of this project.

Based on the findings, the project would be considered less than significant for GHG emissions. If you have any questions, please do not hesitate to contact me directly at (760) 473-1253.

**Sincerely,**
